

**FREE OPEN-SOURCE DELPHI MIGRATION
UTILITY**

Convert VCL projects toward FireMonkey with clear reports and editable mapping packs.

VCL2FMXConverter helps Delphi developers move VCL projects toward FMX by converting many common forms, components, properties, events, and project structures into FireMonkey equivalents.

The converter is designed to reduce repetitive migration work and produce

Current Stable Release

v4.1.8

Stable source release

- Mapping-pack support for third-party components
- Binary and text DFM handling
- Improved Windows message and GDI reporting
- Cleaner conversion reports and source safeguards
- Source distribution for Delphi users to build and modify

a strong FMX starting point. Items that cannot be converted safely are reported for manual review instead of being hidden.

[Read the User Guide](#)

What the converter does

The project focuses on practical VCL-to-FMX migration assistance, not unrealistic one-click conversion. It converts what it can handle safely and documents the rest.

Forms and components

Converts many standard VCL visual controls to FMX equivalents and preserves layout information where practical.

Properties and events

Maps common VCL properties and events into FMX names and structures when the conversion is safe.

Reports and review

Generates readable reports for unsupported APIs, third-party controls, manual review items, and conversion risks.

Downloads

Keep this section short and direct. Developers should not have to hunt for the source package or documentation.

VCL2FMXConverter v4.1.8 Source Code

Complete source package with mapping packs. Build and run with Delphi/RAD Studio.

Additional Mapping Packs

Optional JSON mapping packs for third-party Delphi component families.

[Download ZIP](#)

JSON Mapping Pack Studio

Optional companion tool for creating and editing mapping-pack JSON files.

[Download](#)

Mapping packs

Mapping packs are optional JSON rule files that let users inspect, modify, and extend third-party component support.

Transparent rules

A mapping pack can convert simple components, partially convert components with warnings, detect

Community-extensible

Developers can create or adjust packs for component libraries they own and understand, without

complex controls, or preserve selected references when appropriate.

forcing unsafe assumptions into the converter core.

Known limits

This section should stay visible. It makes the project more trustworthy and reduces unrealistic expectations.

No automated converter can safely convert every VCL application to FMX. VCL and FMX differ in rendering, Windows message handling, data binding, platform behavior, and component libraries. VCL2FMXConverter converts what it can safely handle and reports uncertain or unsafe items for manual review.

Contact and feedback

Bug reports, test results, and suggestions are welcome. Please include the converter version, Delphi version, and a short description of the project or error.

VCL2FMXConverter

Free and open-source Delphi VCL-to-FMX migration assistance.

Suggested Page Structure

A simpler site map for Wix, WordPress, or another static page builder.

Home

Short description, current release, main download, key features, limitations.

Downloads

Stable source ZIP, guides, mapping packs, JSON Mapping Pack Studio, license.

Mapping Packs

What they are, included vendors, how they work, and how users can modify them.

Documentation

User Guide, Engineering Guide, rules references, and conversion report examples.

Release Notes

Version history written plainly, with stable/current release clearly identified.

Contact

Feedback instructions, email/contact form, and what details to include in bug reports.

Text to Remove or Replace

Use this as a practical editing checklist.

Remove or soften

Avoid claims such as "up to 95%" or wording that implies guaranteed full conversion. Remove repeated marketing phrases and old v4.0 references.

Use instead

"The converter reduces repetitive migration work and provides a strong FMX starting point. Some projects will require manual review depending on APIs, controls, and custom code."
